

NSW National Parks and Wildlife Service

Draft Conservation Action Plan

Crest-tailed mulgara (Dasycercus cristicauda)

This plan has been prepared in accordance with the requirements of s.78C of the National Parks and Wildlife Regulation 2019 (Reg.) in relation to an Asset of Intergenerational Significance (AIS) as declared under s.153G of the *National Parks and Wildlife Act 1974*.

Site details

AIS site	AIS-E0-219
Site location	An area of 2,228 hectares in Sturt National Park
NPWS contact	Senior Project Manager, NPWS feral predator-free areas - partnership projects

Environmental values

This table sets out the environmental values for which the land was listed as an AIS (Reg. 78C(3)(a)).

Identified values	Value description
Feral predator-free areas and important habitat to enable reintroduction, establishment and maintenance of viable wild populations of the crest-tailed mulgara, currently listed as extinct in NSW.	The crest-tailed mulgara is a small, compact carnivorous mammal that inhabits burrows in the broad swales between vegetated sand dunes. Active both day and night, it often basks in the sun when possible and seeks shelter in burrows during the hottest periods. Most foraging occurs at night, with its diet consisting of small vertebrates, insects, and other arthropods. All its water needs are met through its food intake.
	Surveys have recorded the species in NSW however, it is considered transient with stable wild populations occurring across the NSW border in SA and in NSW within feral predator-free areas.

Key risks to environmental values

This table sets out the key risks to the environmental values of the land (Reg. 78C(3)(b)).

Key risks	Description
Inappropriate fire regimes	Inappropriate fire timing, frequency and/or intensity that alters vegetation composition and structure may lead to a reduction in suitable habitat, food availability and/or affect the persistence of the crest-tailed mulgara at the site.
Feral predators	Predation of the crest-tailed mulgara by foxes, feral cats and wild dogs, in the event of an incursion into the feral predator-free area.
Feral herbivores and pigs	Competition for resources and degradation of crest-tailed mulgara habitat by introduced herbivores, such as rabbits and goats, through grazing and trampling, in the event of an incursion into the feral predator-free area. Direct predation, competition, habitat degradation and/or disease transmission by feral pigs may lead to a decline of the crest-tailed mulgara at the site, in the event of an incursion into the feral predator-free area.
Disturbance	Damage to the conservation fences and associated infrastructure from authorised maintenance activities, unauthorised activities, fires, floods and/or vandalism may increase the risk of feral predator, feral herbivore and/or feral pig incursion.
Inbreeding depression and loss of genetic diversity	Inbreeding depression within the crest-tailed mulgara population that leads to a reduction in the survival of individuals and recruitment, may affect persistence of the species at the site.
	Low genetic diversity that limits the ability of the crest-tailed mulgara to adapt to the host environment, may affect persistence of the species at the site.

Conservation activities

This table sets out the conservation activities required to:

- 1. control, abate or mitigate the key risks and
- 2. maintain, restore and remediate the environmental values of the land (Reg. 78C(3)(c)).

Key risks	Impacted site	Conservation activities
Inappropriate fire regimes	AIS-E0-219	 Develop guidance on the appropriate fire management for the habitat of the crest-tailed mulgara within 12 months of adoption of this plan and update as required. This guidance must provide for: maintenance of an appropriate fire regime by developing and implementing a site-specific burn plan for the declared area implementation of any required fire protection and response measures in the declared area integration of site-specific requirements into NPWS and NSW Government bushfire planning, risk management and operational response arrangements.
		Implement fire management consistent with the guidance.

Key risks	Impacted site	Conservation activities
Feral predators	AIS-E0-219	 Maintain the density of feral predators (e.g. foxes, feral cats and wild dogs) inside the feral predator-free area at zero by responding to any incursions with trapping, baiting, shooting and other approved measures. Implement trapping, baiting, shooting and other approved measures in a buffer area outside the conservation fences to reduce the risk of feral predator incursion. Develop a feral predator incursion plan within 6 months of adoption of this plan, and in the event of an incursion implement feral predator control response. Undertake regular assessments of conservation fences, and if required repair these fences, to ensure a reduced risk of feral predator incursions.
Feral pigs	AIS-E0-219	 Maintain the density of feral pigs inside the feral predator-free area at zero, by responding to any incursions, with trapping, baiting, shooting or other approved measures.
Feral herbivores	AIS-E0-219	 Maintain the density of large feral herbivores (e.g. goats) inside the feral predator-free area at zero, by responding to any incursions, with trapping, shooting or other approved measures such as mustering and removal. To the extent practicable reduce the density of rabbits to zero, or to levels that are not having an ecologically significant impact on the crest-tailed mulgara and maintain the densities at or below those levels by trapping, baiting, shooting or other approved measures.
Disturbance	AIS-E0-219	 Undertake periodic reviews to identify whether authorised maintenance activities, unauthorised activities, fires, floods and/or vandalism are having an adverse impact on the conservation fences and associated infrastructure. If adverse impacts are observed implement actions to mitigate the impacts. This may include: installation of signs, threatened species marker posts or barriers to delineate sites and minimise impacts compliance activities. If required, develop and implement guidance for staff, utility managers, and/or contractors, about appropriate maintenance practices that minimise or prevent impacts to the crest-tailed mulgara and its habitat.
Inbreeding depression and loss of genetic diversity	AIS-E0-219	 In this context, each feral predator-free area is regarded as hosting a crest-tailed mulgara sub-population (deme). Conduct genetic analysis of the crest-tailed mulgara sub-population at appropriate intervals, to support conservation and recovery of the species at the site and across all sub-populations. As required, maintain and improve the genetic diversity of crest-tailed mulgara sub-populations through the translocation of suitable individuals.

Other land management activities

Within the declared land there are existing assets and infrastructure of NPWS and other external service providers, including public utilities.

Crest-tailed mulgara (*Dasycercus cristicauda*) Draft Conservation Action Plan

Maintenance operations (including inspection, emergency works and routine and standard maintenance) that are exempt development in accordance with the *Environmental Planning and Assessment Act 1979*, and which are performed on and around existing assets and infrastructure, are authorised under this conservation action plan (CAP) provided such operations are undertaken in a manner that aims to minimise the risk to the declared environmental values of the land and with any other required consents or approvals.

All maintenance operations on the declared land are to be undertaken in accordance with this CAP.

Measuring and reporting

This table sets out the requirements for measuring and reporting on health and condition (Reg. 78C(3)(d)).

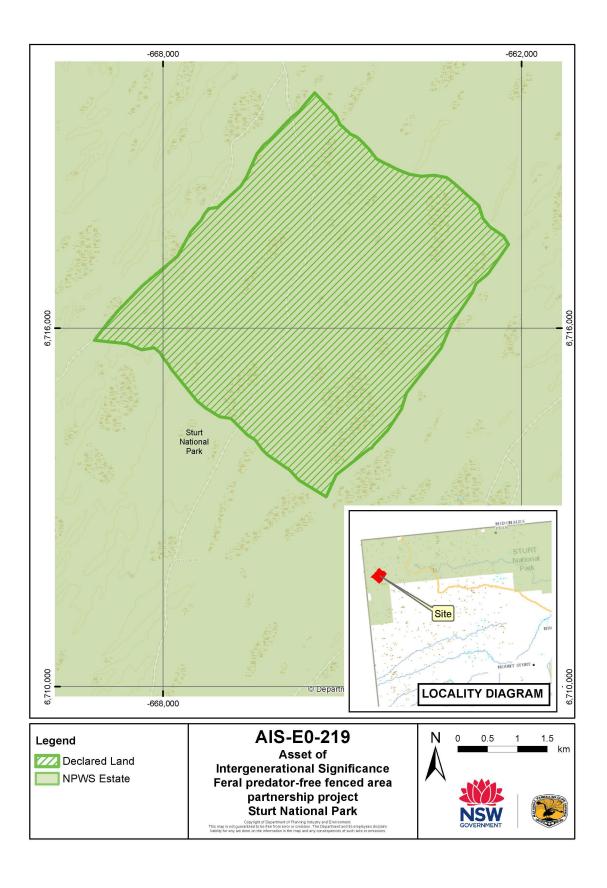

Attribute	Metric	Method
Health and condition of the crest-tailed mulgara at the site	Population estimate	Design, and implement monitoring annually for 3 years from approval date on this CAP (initial monitoring period), to generate an estimate of the number of individuals at the site.
		After the initial monitoring period, and subject to the approval of the Secretary or delegate, undertake monitoring every 2 years.

A report on the health and condition of the value for which this AIS was declared will be prepared and published on the Department of Climate Change, Energy, the Environment and Water website: www.environment.nsw.gov.au. The report will summarise the baseline and current health and condition of the values of the declared land and its overall trajectory.

Evaluation of conservation action plans

This CAP will be amended or replaced as new information becomes available that helps improve our management of the identified asset (Reg. 78H).

The Secretary must appoint a scientist, or a panel of scientists, to conduct a review, as soon as possible after the period of five years from the first approval of a CAP, to examine whether CAPs have been effectively implemented (Reg. 78J(1)).
